Quipu achieves SOC 2 Type 1 Certification

Quipu has successfully obtained SOC 2 Type 1 certification, as confirmed in March 2025. This achievement demonstrates our commitment to maintaining the highest standards of security, availability, confidentiality, and processing integrity in the services we provide.

What is SOC 2 Certification?

SOC 2, or System and Organization Controls 2, is a security framework developed by the American Institute of Certified Public Accountants (AICPA). It specifies how organizations should protect customer data from unauthorized access, security incidents, and other vulnerabilities. SOC 2 compliance involves adhering to five Trust Services Criteria: security, availability, processing integrity, confidentiality, and privacy.

Why is SOC 2 Important in IT for the banking industry?

In the banking industry, where sensitive customer data is handled daily, maintaining robust security measures is crucial. SOC 2 certification ensures that financial institutions

and their service providers have the proper systems and procedures in place to safeguard customer data. This certification signals to clients, partners, and regulators that data security is a top priority, making it an essential certification for businesses operating in cloud services, data centers, and other IT-related fields.

By achieving SOC 2 Type 1 certification, Quipu has demonstrated its dedication to protecting customer information and maintaining the highest standards of data security. This certification not only enhances the trust at the level of our bank customers but also supports them in building trust with their clients, the end-users of the services, ensuring that their data is handled with the utmost care and integrity.
